EXHAUST EMISSION PURIFICATION DEVICE FOR INTERNAL COMBUSTION ENGINE

5

ABSTRACT OF THE DISCLOSURE

An exhaust emission purification device comprises a 10 sulfur component holding agent arranged on the exhaust path of an internal combustion engine for holding a sulfur component, a NO_{x} holding agent arranged downstream of the sulfur component holding agent in the exhaust gas for holding NO_{x} and the sulfur components when the airfuel ratio of the exhaust gas flowing thereinto is lean, 15 and a reducing agent adding unit for adding a reducing agent to the exhaust gas flowing into the NO_{x} holding agent. The concentration of the sulfur component contained in the reducing agent added by the reducing 20 agent adding unit is lower than the concentration of at least the sulfur component contained in the fuel supplied to the combustion chamber of the internal combustion Thus, the sulfur poisoning of the exhaust emission purifier can be avoided while at the same time 25 reducing the fuel consumption rate.
